

"Unknown Organism" Found in Roundup Ready Crops

A Purdue University researcher has linked Monsanto's Roundup Ready crops to an organism leading to miscarriages and spontaneous abortions in farm animals.

Professor Emeritus Don M. Huber has sent a letter to Agriculture Secretary Tom Vilsack, warning that an "electron microscopic pathogen" found in high concentrations of GM crops could significantly impact the health of both animals and humans.

The organism was previously unknown and is only visible under a 36,000X electron microscope.

"For the past 40 years, I have been a scientist in the professional and military agencies that evaluate and prepare for natural and manmade biological threats, including germ warfare and disease outbreaks," Huber noted in the letter.

"Based on this experience, I believe the threat we are facing from this pathogen is unique and of a high risk status. In layman's terms, it should be treated as an emergency."
